Master Power Technologies Receives 2016 Sub-Saharan African Company of the Year Award

Master Power Technologies has clearly demonstrated a comprehensive understanding of the Sub-Saharan Africa data centre industry, including the challenges that impede growth and opportunities that could be exploited within this market. It has successfully introduced modular and mobile plug-and-play data and energy centres, which have enabled industries such as telecommunications to leapfrog the traditional infrastructure and expand their services to remote areas. Master Power Technologies' solution is a game changer for the data centre industry and its benefits include cost and time savings, simplified planning, improved reliability, and agility, efficiency, and a higher level of vendor accountability.

“Master Power Technologies has a strong R&D division that constantly strives to develop products that monitor, measure, manage, and maintain equipment from a remote location. This proactive approach enables it to present predictive maintenance and fault diagnosis. All the analysed data is available via touch screens at the actual secure power centre, customer site, and mobile phones.”
